✓Activity of the dehydrogenases of muscular tissue in various functional states of the organism. E. V. Lakhno and R. V. Chacovets (Inst. Biochem. Acad. Sci. Ukr. U.S.S.R., Kiev). *Ukrain. Biokhim. Zhur.* 23, 296-307 (in Russian, 308-9) (1958).—The activity of the dehydrogenases was expressed in % of anaerobic decompr. of methylene blue/100 mg. of tissue/min. Exptl. work was effected by excitation of the rectus femoris of rabbit through the skin by a 60-cycle current for 5 min. to 5 hrs. The av. decrease in the activity of the dehydrogenases after 1-hr. work was: of glutamic acid (I) 66.1%, β -hydroxybutyric acid (II) 43, lactic acid (III) 29.6, and malic acid (IV) 33.4%; after 1-2-hr. rest, I 30 and II 20%; after 30-min. rest, III 22 and IV 30.9%. The activity was not completely restored even when a 17-hr. rest followed 10 min. of work. Excitation of the muscle of a narcotized animal resulted in a considerably lower decrease in dehydrogenase activity, but the muscle excitability was also much lower in narcosis. The excitation was accomplished by pain, setting up a defense reaction; possibly narcotics may normalize the subcortical regulation of the metabolism of the irritated muscle, resulting in greater conservation of work ability and consequent lesser destruction of the process of resynthesis. Exptl. training increased the activity of the dehydrogenases.

Reducing properties of muscle tissues and cerebral Hemispheres under various functional conditions of the organism.
R. V. Lakhina and R. V. Chagovets, *Doklady Akad. Nauk S.S.R.* 91, 133-6 (1958). Tissues of rabbits were examined as to their reducing properties (with methylene blue as the reagent). A single stimulation of muscle through the skin over 1 hr. led to considerable decline of the reducing properties of the tissue and reduced activity of dehydrogenases of glutamic, hydroxybutyric, lactic, and malic acids. Exptl. training of the muscle leads to some increase of the reducing properties and enzymatic activity. The study of the gray and white matter of front and mid-parts of the brain was made similarly. After 1-hr. stimulation (induction current) the reducing properties of the gray matter and the white matter lying directly below the former were reduced by 20-40%; after a 2-hr. rest the decline was somewhat normalized and was noted even after 17 hrs. rest. Exptl. training over 2 weeks led to a 66% increase in the reducing properties of the gray matter. Narcosis by barbiturates lowers the dehydrogenating properties of both gray and white matter (30-40% and 20-26%, resp.). Elec. stimulation of narcotized animals led to a higher reducing ability of the hemisphere that was being stimulated (difference of some 30%), indicating that under narcosis the effect of stimulation or irritation is more localized. Infiltration block of the spinal nerve of a rabbit with procaine while the animal was under narcosis, followed by elec. stimulation of the hind leg muscle for 1 hr., led to no detectable difference in the reducing properties of the 2 hemispheres. G. M. K.

1 ✓ Influence of isonicotinyl hydrizide on the oxidation-reduction properties, ascorbic acid, and glutathione in tissues of guinea pigs. E. V. Lashko and R. V. Chagovets. *Dopovid. Akad. Nauk Ukr. R.S.R.* 1957, 100-1 (Russian summary, 1958).—Assuming that isonicotinyl hydrizide (I) influences oxidation-reduction processes in the organism, the following changes in the tissues of healthy guinea pigs were obtained from 80 mg./kg. of I for 7-8 days: reducing power (in γ of methylene blue 20 g.) of liver was increased from 197.0 ± 16.8 to 283.2 ± 44.2 ; there were no changes in brain, lung, and muscle. The ascorbic acid in (II) adrenal glands was decreased; free II was up to 40% of normal (35.7 mg. %) and bound II up to 50% of normal (27.5 mg. %). In liver, kidney, and spleen bound II was especially decreased. In brain hemispheres II was decreased noticeably. The analysis of blood, brain, and kidney showed a general decrease of glutathione (III) in the organism. In the liver oxidized III increased at the expense of reduced III with a nearly unchanged total III. A. Semenov

✓ The determination of nicotinic acid, nicotinamide, and codehydrogenases I and II in muscle tissues by chromatographic methods. L. M. Kuznetsova and R. V. Chagovets (Inst. Biochem., Acad. Sci. Ukr. S.S.R., Kiev). *Ukrain. Biokhim. Zhurn.* 27, 187-91 (Russian summary, 191-2) (1955). — In paper chromatography, it is essential that the codehydrogenase-splitting enzymes be rapidly inactivated. To accomplish this the muscle tissue was ground in the cold, placed into a boiling water bath and boiled for 3 min. By means of vacuum desiccation at 60-80° the vol. was reduced to 1/10 of the original. A sample of the concentrate equivalent to 300-400 mg. of tissue is placed on the 154M paper. In the case of upward (ascending) type of chromatography an 80% H_2O soln. of $MgCO_3$ was used which ascended approx. 20 cm. in 8 hrs. Several runs were made at one time. For the development of distribution positions of nicotinic acid and nicotinamide the method of Kramenets'ki (C.A. 48, 6918c) was used. Within an hr. yellow spots appeared. The position of codehydrogenase was made visible by subjecting another chromatostrip for 1 hr. to the activity of a 1:1 mixt. of acetone and NH_4OH ; this resulted in the appearance of clear-cut fluorescent spots under ultraviolet illumination. For the detns. the corresponding spot positions of another chromatogram were treated chemically as follows: the exts. contg. the nicotinic acid and the nicotinamide were treated by the Kramenets'ki method. The codehydrogenase ext. was tested by the fluorescent method following treatment with acetone at alk. pH. Other substances such as adenosine triphosphate whose R_f is nearly identical to that of the codehydrogenases may be present in the codehydrogenase ext. When that is suspected, another H_2O ext. of the codehydrogenase spot is subjected to supplemental acid hydrolysis, after which it is treated by the method as for nicotinic acid and final detn. made colorimetrically. It was found that some of the methods proposed heretofore for the detn. of codehydrogenase produced high results. B. S. Levine (1)

CHAGOVETS R.V.

Changes in the activities of some dehydrogenases of the brain and muscles in evipan narcosis. R. V. Chagovets, R. V. Lekhno, and I. M. Kurnetsova (Inst. Biokhimiia Acad. Nauk Ukr. S.S.R., Kiev). *Ukrain. Biokhim. Zhur.* 27, 408-12 (1955) (Russian summary).—In rabbits under evipan narcosis for one hr. there occurs a diminution in the reducing substances of the gray matter of the cerebrum and in the skeletal muscles while the lactic and glutamic dehydrogenases become activated under certain conditions. In the muscles of the thigh there is a similar diminution in the reducing substances and an activation of the dehydrogenases of glutamic, lactic, and citric acids. Muscle pulp of rabbits kept under evipan narcosis for 1 hr. loses its ability to utilize added glycogen. B. S. Levine.

~~Chagovets, R.V.~~

Changes in content and distribution of riboflavin in rabbit muscle in work and in narcosis. I. B. Epshtejn and R. V. Chagovets (Agr. Inst., Belotserkov). Doklady Akad. Nauk S.S.R. 105, 319-22 (1955).—Free riboflavin in muscle of rabbits in a state of muscular activity and under Evgipan-sodium narcosis amounted to no more than 2% of the total riboflavin. Expts. with the leg muscle tissues of the animals showed that muscular work (stimulation) increased the total riboflavin, which was indicative of a greater supply of the substance via the circulatory system. Thus, in working muscle, synthesis of coenzymes of the flavine-dinucleotide type takes place. The changes in riboflavin content and distribution were the same in narcotized as in non-narcotized animals. Some difference in the level of stimulability in the narcotized animals. Some difference in the comparison with the normal ones. Thus, the riboflavin compounds formed in the muscle are not controlled by the functional state of the central nervous system. G. M. K.

"Effects of Aminazine on the Dehydrogenase Activity of the Cerebral Cortex, Cerebellum, and Muscles," by R. V. Chagovets and Ye. V. Lakhno, Institute of Biochemistry, Academy of Sciences Ukrainian SSR, Kiev, Voprosy Meditsinskoy Khimii, Vol 3, No 1, Jan/Feb 57, pp 36-39

This article reports results of experiments which were conducted to determine the effect of aminazine on the reducing properties of dehydrogenase activity of the cerebral cortex, cerebellum, and muscles of rabbits. The animals were administered aminazine subcutaneously in doses of 15 to 25 milligrams per kilogram of body weight, and were decapitated 3.5 hours later. The experiments established that aminazine caused a decrease in the reducing properties of the tissues, particularly marked in the cerebral cortex, less pronounced in the cerebellum, and still less in the skeletal muscles. A marked depression in the activity of the dehydrogenases was noted as a result of the administration of aminazine.

TOPIC TAGS: optic fiber, fiber glass

ABSTRACT: An Author Certificate has been issued for a method of making glass-reinforced fiber for optics. It consists of a light-transmitting core and a light-insulating sheath, which is made by drawing simultaneously a glass rod encased in glass tubing while maintaining a certain tolerance between them. A close adherence of the core to the sheath is achieved by evacuating the air in the process of drawing from the cavity between them. [LD]

✓ 1347. REMOVAL OF SULPHUR FROM GASES WITH PEROXIDE ORE, Dzerzhinsk
U.S.S.R. (Prod. Inst., Teplo, Dzerzhinsk, U.S.S.R.)
Date: 1959; Author: Dr. Kulan, I. V.; Source: Sov. Chem. Ind.
Abstract: Experiments are concerned on the removal of sulphur from
gaseous mixtures containing hydrogen sulphide, organic sulphides,
and organic sulphur with manganese dioxide. The capacity of the ore
is 200 g sulphur. In the process manganese dioxide is reduced to manganese
oxide, with a considerable increase in volume and conversion of organic sulphur
into hydrogen sulphide. The latter combines with manganese dioxide to form
manganese sulphide. The ore is regenerated with air.

The use of manganese-containing oxides for the purification of gases with respect to hydrogen sulfide and carbon disulfide. V. T. Chusovitsa and V. G. Jacobson.

Manganese sulfide is a general name for various manganese compounds containing sulfur. Manganese sulfide is a black powder, one such mass contains Mn₃S₂. It can adsorb H₂S and gases by the reaction Mn₃S₂ + H₂S → Mn₃(HS)₂. H₂S is removed both by adsorption and formation of manganese sulfide. The masses can be regenerated by heating for 4 hrs. at 900–50°, and then for 2 hrs. at 700–50°; up to 600 g. S/I. can be driven off during the regeneration. Verner Jacobson

TITLE: Manganese method of desulfurization for sulfur-containing crude oils

SOURCE: AN GruzSSR. Institut prikladnoy khimii i elektrokhimii. Trudy, v. 4, 1963, 23-28

TOPIC TAGS: desulfurization, petroleum, manganese oxide

ABSTRACT: Laboratory experiments have shown the feasibility of desulfurizing light fractions of sulfur-containing crudes over reduced manganese ore catalyst. It is noted that the desulfurization of sulfur-containing crudes is one of the most urgent problems of (Soviet) petroleum technology. The desulfurization catalyst was prepared by reducing manganese ore (manganese peroxide) to MnO with a nitrogen-hydrogen mixture at 300—350°C. Desulfurization was conducted in specially designed equipment (described and diagrammed in the original article). Vaporized sulfur-containing Bashkir crudes mixed with a nitrogen-hydrogen mixture (from the thermal decomposition of ammonia) were passed over MnO at 350°C and atmospheric pressure. The bulk of sulfur compounds present were converted to H₂S which in turn reacted with MnO: MnO + H₂S → MnS + H₂O. The desulfurized crude recovery was 97.5—98% and the degree

Card 1/2

L 1449-66

ACCESSION NR: AT5023074

of desulfurization (one pass) was 77.4--84%. Further experiments planned to improve the desulfurization will involve elevated pressures (30 atm) and semi-works scale tests. Orig. art. has: 3 figures and 3 tables. [SM]

TITLE: On the problem of desulfurizing sulfurous petroleum with manganese compounds

SOURCE: AN SSSR. Bashkirskiy filial. Khimiya seraorganicheskikh soyedineniy, soderzhchikhsya v neftyakh i nefteproduktakh, v. 7, 1964, 196-199

TOPIC TAGS: desulfurization, petroleum, manganese, kerosene, catalyst, benzene

ABSTRACT: A series of experiments was carried out with the help of the Institute of Petroleum-Chemical Synthesis hydrogenation laboratory to hydro-refine kerosene fractions (0.9% S) and hydro-crack Arlanskiy high-sulfur petroleum (3.2%), using manganese peroxide ore. The experiments were conducted in a laboratory apparatus with a stationary layer of manganese ore catalyst. The optimum test conditions were: 30 atm pressure, 450°C temperature, 0.5 liter/liter-hour volume rate, and 500 liter/liter-hour hydrogen flow rate. Comparison of the kerosene samples before and after desulfurization shows an 83% reduction in the sulfur content. Orig. art. has: 3 tables and 1 figure.

TITLE: Desulfurization of sour crude oil with manganese

SOURCE: Ref. zh. Khimiya, Part II, Abs. 18P93

REF SOURCE: Sb. Issled. po khim. pererabotke rud. Tbilisi, Metsniyereba, 1966,
47-51TOPIC TAGS: petroleum product, manganese, desulfurization, sour crude oil,
molybdenum sulfide, hydrofining, hydrocracking

ABSTRACT: Pyrolusite and other manganese ores were used in tests in a reducing atmosphere to refine petroleum fractions (F) by removal of sulfur. During the reaction, H₂S is released from the gas mixture and the reaction equilibrium is moved to the right. The hydrofining of the fuel fractions can be successful at 450C under pressure of 30 atm, an 0.5 l/hp-hr cycle rate, and a 500 l/hp-hr H₂ consumption rate. Thus, in the HK-120 F at 120—200C, the S content of Arlan² petroleum can be reduced from 0.0356 and 0.285% to 0.0059 and 0.066%, respec-

Card 1/2

ACC NR: AR6033758

tively. The formation of molybdenum sulfide decreases the catalyst's activity, which is restored after air blowing at 700-750C. The S content in the kerosene F can be reduced from 0.9 to 0.15%. During hydrocracking of Arlan petroleum (S content = 3.2%) a catalyzats with 0.7% of S is obtained with a manganese catalyst at a 1 l/hp-hr cycle, a 1000 l/hp-hr H₂ supply, and a temperature of 450C. The yield of the hydrogenation product amounted to 85% for raw material. The HK F content in the hydrogenation product was 23.4% at 180C, 37.5% at 180-300C, and the residue, 39.0% at 7300C. The coke content was 4.5%, that of gas and losses-10.5%. I. Rozhkov. Bibliography has 12 titles.

Modifications of the level of glutathione in the blood of adrenalectomized rats and in rats with grafts of adrenal tissue in the eye. V. Arnović, V. Milosavljević, M. Anđel, and X. Čahović. *Bull. crad. srpsk. sci.* 11, No. 2, 9(1954); *Biochim. biophys.*, Sect. 11, 9, 5(1958).—Adrenalectomy resulted in a decrease of reduced glutathione (I) in the blood of rats the first few days after the operation. After 3-6 days a rise of I set in, which eventually stopped at the normal level. At the same time the I content of the liver, after an initial slight rise, fell rapidly, while the general state of the animal deteriorated. When adrenal tissue was implanted into the eye of the animal, the blood level of reduced I remained normal for several months and the total I was found to be even higher than in normal animals.

TITLE: Effect of changes in the gravitational field on the coordination of voluntary movements in man

PERIODICAL: Akademiya nauk Gruzinskoy SSR. Soobshcheniya
v.28, no.5, 1962, 593-600

TEXT: This is a part of a study on general problems of coordination of voluntary movements during frequent and prolonged changes in the gravitational field. Tensometric recordings of the parameters of leading dynamic components of a certain movement were analyzed. The individual was subjected to centrifugation in order to obtain increased gravitational force. Stable gravitations of 3g and 7g and gradually increasing gravitations of 0-7g were employed. Impairment in the blood supply to the upper parts of the body was

Effect of changes in the gravitational field...

avoided by directing the load postero-anteriorly (back-thorax). The load lasted 100 sec and the individual had to press a finger, without control of the eyes, on a hard object. The pressures had to be performed in pairs, whereby the force applied in the second pressure had to be one half of that applied in the first one. The changes in the ratio of these couples of forces indicated the quality of coordination. Impairment in coordination of voluntary movements within increased gravitational fields depends on the training and general condition of the individual and is proportional to the logarithm of the acceleration of the gravitational forces. Systematic performance of the impaired movements recovered coordination. The recovery depends also on the magnitude of gravitation and the constancy in the rate of performance. There are some reasons to consider these conclusions valid also for a field in which gravitation equals zero (weightlessness). The characteristics of muscle activity during

PURPOSE: This book is intended for mathematicians and physicists.
 COVERAGE: The book is Volume 37 of the Transactions of the Third All-
 Union Mathematical Conference, held in June and July 1956. The
 book is divided into two main parts. The first part contains sum-
 maries of the papers presented by Soviet scientists at the Con-
 ference that were not included in the first two volumes. The
 second part contains the text of reports submitted to the editor
 by foreign Soviet scientists. In those cases where the non-Soviet sci-
 entist did not submit a copy of his paper to the editor, the title
 of the paper is cited and, if the paper was printed in a previous
 volume, reference is made to the appropriate volume. The papers,
 both Soviet and non-Soviet, cover various topics in number theory,
 algebra, differential and integral equations, function theory, topology,
 mathematical analysis, probability theory, topological mathematics,
 foundations of mechanics and physics, computational mathematics,
 foundations of logic and the foundations of mathematics, and the
 history of mathematics.

TITLE: News from the Iron Metallurgy Institute in Gliwice -
the Teepol Reagent as a Means to Determine Granular
Sizes in Steel

PERIODICAL: Hutnik, 1959, Nr 4, pp 167-172 (Poland)

ABSTRACT: The Polish trade name for the picric acid reagent known abroad as Teepol is Alkilo. Experiments carried out at the Institute in Gliwice showed that Teepol may be used in most cases and with most varieties of steel, this reagent may be used to reveal the granular structure of the metal. In the experiment, the time allowed for the reaction ranged from 5 to 12 minutes, depending on the concentration of the reagent and the type of steel tested. Reaction time can be shortened to 1 - 3 minutes, it was found, if the temperature of the experiment is raised to 55 C. After the reaction the metal surface was slightly polished before microscopic examination. There are 15 microphotographs, ✓

13 figs.

Analyses of underground salt waters in Polish oil and gas beds sometimes reveal the presence of considerable content of unutilised iodine and bromine. The description of an apparatus designed by the author for the production on a semi-technical scale of iodine and bromine from salt waters. The specific operations of the method, such as cleaning the salt water, adsorption, distillation and refining of iodine and bromine are dealt with. The quantities of products obtained proved this method to be economical having regard to the existing concentration of iodine and bromine in numerous Polish petroleum salt waters.

V 1292. Chemical character of waters of the lower chalk. W.
Chajec. *Bull. Polish Inst. Petrol.*, 1954, 4, 5 (suppl. to *Nauka*
(Krakow), 1954, 10).—Polish IP (section "brines") has
compiled notes on subterranean waters from newly drilled
holes. Compared with data from 1933 for one of the older
boreholes, little change was observed. A table giving the
composition of 2 strata is included. M. S.

✓ 788. Chemical characterization of aqueous levels of Miocene and Oligocene. W. Chojec. *Bull. Polish Inst. Petrol.*, 1955, 5, 9-10 (suppl. to *Nauka i Technika*, 1956, 11). As a part of a general scheme of identification 1200 analyses have been done. Average composition of Miocene and Oligocene waters from 7 areas are given in tables. Exceptional quantity (144 mg/litre) of iodine has been found in Skoczow area.

Orig Pub : Gaz, woda, techn. sanit., 1956, 30, No 4, 129-130

Abstract : The Institute of Mineral Oil and Gas carried out many analyses of underground waters from Carpathian and the Podgazha (Poland) regions connected with mineral oil and gas deposits. 16 analyses of waters from various regions and various geological formations (Oligocene, Eocene, Miocene, etc.) are presented. The composition of these waters is in g per liter as follows;
